The invention relates to an isolated nucleic acid comprising any one of the foll antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid nucleic acid; (2) a host cell containing the vector; (3) an isolated convocate acid; (4) an antibody capable of specifically binding polypeptide acid; (4) an antibody capable of specifically binding antisense nucleic acid; (4) an antibody capable of specifically binding colliferation or the activity of agene in an operon required for proliferation or the activity of agene in an operon required for proliferation, (7) identifying a compound that influences the activity of required for proliferation, or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the gene or which the test compound that inhibits proliferation of an organism. The antisense nucleic acids are useful for strains; or (13) identifying the target of a compound that inhibits the control of a proliferation of an organism. The antisense nucleic acids are useful for for displace molecules for rational
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     12;

This invention describes a novel method for the fermentative production of methionine by growing a sulphur-producing Coryneform bacteria that expresses at least one heterologous nucleic acid encoding a protein with methionine synthase (MetH) activity. Methionine acumulates in the medium or the cells. The method can be used to produce an L-methionine.

Containing animal feed additive by culturing an L-Met-producing minal feed additive by culturing an L-Met-producing minal feed additive by culturing an L-Met-producing minal feed additive by culturing an L-Met-producing containing animal feed additive by containing broth, removing 0-100% of the biomass formed and drying the product to produce the feed additive containing animal feed additive by containing animal feed additive corynebacterium glutamicum Arcc 1302. Optionally at least one other gene in the methionine biosynthesis pathway (e.g. aspartate kinase, corynebacterium glutamicum Arcc 1302. Optionally at least one other gene corynebacted so that it is not affected by metabolites. Also at least one metabolic pathway that reduces production of methionine is at least parelly switched off (e.g. homoserine kinase, threonine synthase) the method is especially used to produce L-methionine, useful as an additive for animal feeds. More generally sulphur-containing fine chemicals are useful in human and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Fermentative production of sulfur-containing compounds, particularly Lemethionine, useful as feed additives, by using Coryneform bacteria that

method for evaluating a compound for the ability to bind a P. mirabilis polypeptide and a method for screening test compounds for anti-bacterial activity. The polypeptides and polymucleotides are useful as molecular targets for diagnosing, preventing and treating pathological conditions resulting from bacterial infection, as reagents for diagnosis of abscrerial diseases, as components of antibacterial vaccines, as targets for antibacterial dragons or as bio-control agents for plants. This sequence represents a Proteus mirabilis polymucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    GGTCCGACTAATAAGACACTCTCTGTGTCCCCATCTGTGGAAAGGCCGGATTATAGGAAC

Clone from S. Wiemann, Molecular Genome Analysis, German Cancer

Research Center (DKF2); Email s.wiemann@dkfz-heidelberg.de;

Research Center (DKF2); Email s.wiemann@dkfz-heidelberg.de;

sequenced by Medigenomix (Martinaried/Germany) within the cDNA

sequencing consortium of the German Genome Project.

This clone (DKF20469P1116) is available at the RZPD Deutsches

Ressourcenzentrum fuer Genomforschung GmbH in Berlin, Germany.

Please contact RZPD for ordering:

lst strand cDNA was primed with a NotI-oligo(dT) primer. Five prime end enriched, double-strand cDNA was digested with Not I and cloned into the Not I and EcoR V sites of the pCMVSPORT 6 vector. Library was normalized. Library was constructed by Life Technologies, a division of Invitrogen. This sequence belongs to sequence cluster 740.f
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1148

This is the 5' sequence of the clone insert
Clone from S. Wiemann, Molecular Genome Analysis, German Cancer
Research Center (DKFZ); Email s.wiemann@dkfz-heidelberg.de;
sequenced by DKFZ (German Cancer Research Center,
Heidelberg/Germanny) within the cDNA sequencing consortium of the
German Genome Project.
No sl sequence available.
This clone (DKFZp313F151) is available at the RZPD in Berlin.
